## Amendments to the Specification:

Page 4, lines 11-16, please amend as follows:

Figure 3 describes an exemplary [[device]] <u>frequency synthesizer</u> according to the invention, comprising, for example, a variable-step frequency synthesizer 10 that delivers a signal to a variable-rank N<sub>b</sub> divider 11 whose fundamental frequency ranges between a frequency F3 and a frequency F4. [[It]] <u>The frequency synthesizer</u> comprises [[a]] <u>the</u> variable-rank Nb divider 11 <u>connected at an input to be variable-step frequency synthesizer 10</u> that assumes the values N1 to Np (with N1<N2...<Np), a control device 12 to control the output frequency <u>connected at output to the variable-step synthesizer 10</u> and at another output to the variable-rank divider 11 and, as the case may be, a filter 13.

Page 6, lines 8-14, please amend as follows:

In the device according to the invention, the length of the cycle of evolution of Na is variable and dependent on the value Nb (division value of the variable-rank divider). The reference frequency Fref is chosen so that the desired fractional step values are obtained as follows:

- Fref is a function of sequence of the values N1, N2, ... Np that may be assumed by Nb,
- Fref/□F must be a multiple of the Least Common Multiple (LCM) of N1, N2, ... Np.
